(ii) when the interrupting function is -SO<sub>2</sub>- or -SO<sub>2</sub>- it is not β to the COOH function or δ if there is an intervening carbon-carbon double bond in X.

The present invention relates to carbapenems and in particular to such compounds containing a phenyl or thienyl ring substituted by a group bearing a carboxy function. This invention further relates to processes for their preparation, to intermediates in their preparation, to their uses as therapeutic agents and to pharmaceutical compositions containing them.

The compounds of this invention are antibiotics and can be used in the treatment of any disease that is conventionally treated with antibiotics for example in the treatment of bacterial infection in mammals including humans.

Carbapenems were first isolated from fermentation media in 1974 and were found to have broad spectrum antibacterial activity. Since this discovery substantial investigations have been made into new carbapenem derivatives and many hundreds of patents and scientific papers have been published.

The first, and so far the only, carbapenem to be commercially marketed is imipenem (N-formimidoyl thienamycin). This compound has a broad spectrum of antibacterial activity.

The present invention provides compounds with a broad spectrum of antibacterial activity including both Gram positive and negative, aerobic and anaerobic bacteria. They exhibit good stability to beta-lactamases. In addition representative compounds of this invention exhibit a very favourable duration of action.

The carbapenem derivatives referred to herein are named in accordance with the generally accepted semi-systematic nomenclature:

The compounds of the formula (IX) may be prepared by the reaction of an activated derivative of a compound of the formula (X), which may be formed *in situ*, with a compound of the formula (XI):

wherein A, X, R<sup>3</sup>-R<sup>6</sup>, R<sup>8</sup>, R<sup>9</sup> and R<sup>14</sup> are as hereinbefore defined. Activated derivatives of the compound of the formula (X) include acid halides, anhydrides and 'activated' esters such as 1H-benzo[1,2,3] triazol-1-yl, pentafluorophenyl and 2,4,5-trichlorophenyl esters or the benzimidazol-2-yl ester of the thiocarboxylic acid corresponding to (X). The reaction of the compounds of the formulae (X) and (XI) is performed under standard methods, for example in the presence of Vilsmeier reagent (thus forming the reactive derivative of (X) *in situ*) at temperatures in the region -30°C to 25°C, preferably in the region -20°C to 5°C, or in the presence of sulphonyl chloride at ambient temperature.

The compounds of the formulae (X) and (XI) are prepared by standard methods known to the skilled chemist such as the methods of the Examples hereinafter, the methods described in EP-A-126587 or by methods analogous or similar thereto.

Compounds of the formula (IX), wherein X contains a -CONR<sup>3</sup>- group directly linked to ring A, may also

be prepared by reacting an activated derivative of a compound of the formula (XX), which may be formed in situ, with a compound of formula (XXI):

wherein R<sup>5</sup>, R<sup>6</sup>, R<sup>8</sup>, R<sup>9</sup> and R<sup>14</sup> are as hereinbefore defined and X is alkanediyl. Activated derivatives of the compounds of formula (XX) may include the activated derivatives described for the compounds of formula (X).

In general, the reaction between compounds of the formulae (XX) and (XXI) is performed under similar conditions to those used in the reaction between compounds of the formulae (X) and (XI). The reaction may be performed between the acid chloride of (XX) and a compound of formula (XXI) in a solvent such as dichloromethane in the presence of trimethylsilylchloride and a base such as diisopropylethylamine in a temperature range of -30°C to 25°C.

The compounds of the formula (XX) may be prepared by reacting a compound of the formula (X) with a compound of the formula R<sup>8</sup>NH-A-COOR<sup>20</sup>, wherein R<sup>20</sup> is a carboxy protecting group, and subsequently removing R<sup>20</sup>. The compounds of the formulae (XX) and R<sup>8</sup>NH-A-COOR<sup>20</sup> may be reacted together under similar conditions to those described for the reaction between compounds of the formulae (X) and (XI).

The compounds of the formulae (XXI) and R<sup>8</sup>NH-A-COOR<sup>20</sup> are either known in the art or prepared by standard methods known to the skilled chemist.

Suitably, in the compounds of the formula (VIII), R<sup>11</sup>-R<sup>13</sup> are independently selected from C<sub>1</sub>-6 alkoxy such as methoxy, ethoxy, isopropoxy, n-propoxy or n-butoxy; aryloxy such as optionally phenoxy; di-C<sub>1-6</sub>alkylamino such as dimethylamino or diethylamino; diarylamino such as diphenylamino or any two of R<sup>11</sup>-R<sup>13</sup> represent o-phenylenedioxy. Preferably each of R<sup>11</sup>-R<sup>13</sup> have the same value and are C<sub>1-6</sub>alkoxy for example methoxy, ethoxy, isopropoxy or n-butoxy or are phenoxy.

The compounds of the formula (VIII) are cyclized under conventional conditions known in the art to form compounds of the formula (V). Typical conditions are heating in a substantially inert organic solvent such as toluene, xylene or ethyl acetate at temperatures in the region 60-150°C. Typically the reaction is performed in an atmosphere of nitrogen and is carried out in the presence of a radical scavenger for example hydroquinone.

The compounds of the formula (VIII) may be formed and cyclized *in situ*. The compounds of the formula (VIII) may conveniently be prepared by reacting compounds of the formulae (XII) and (XIII):

wherein A, X, R<sup>2</sup>-R<sup>13</sup> are as hereinbefore defined. Suitably the compound of the formula (XIII) is a phosphite or is the functional equivalent of such a compound.

The reaction between the compounds of the formulae (XII) and (XIII) is conveniently performed in an organic solvent such as toluene, xylene, ethyl acetate, chloroform, dichloromethane, acetonitrile or dimethylformamide. Typically the reaction is carried out at an elevated temperature for example 60-150°C.

The compounds of the formula (XII) may be prepared by a number of methods known in the art. For example the compounds of the formula (XII) may be prepared by the acylation of a compound of the formula (XIV):

10 wherein A, X, R<sup>2</sup>-R<sup>6</sup>, and R<sup>8</sup>-R<sup>10</sup> are as hereinbefore defined with a compound of the formula (XV):

wherein R<sup>7</sup> is as hereinbefore defined.

The compounds of the formula (XIV) may be prepared by reacting compounds of the formulae (XVI) and (VII):

20 wherein R<sup>2</sup> and R<sup>10</sup> are as hereinbefore defined. The compounds of the formula (XVI) are known in the art and may be reacted with the compounds of the formula (VII) under conventional acylation methods known in the art.

25 Compounds of the formulae (V), (VII), (VIII), (IX), (XII) and (XIV) are novel and, as such, form another aspect of this invention.

The following biological test methods, data and Examples serve to illustrate the present invention.

### 30 Antibacterial Activity

The pharmaceutically acceptable carbapenem compounds of the present invention are useful antibacterial agents having a broad spectrum of activity in vitro against standard laboratory microorganisms, both Gram-negative and Gram-positive, which are used to screen for activity against pathogenic bacteria. The antibacterial spectrum and potency of a particular compound may be determined in a standard test system. In particular the carbapenems of the present invention show good stability to beta-lactamases and in general show particularly good pharmacokinetics especially with regard to half life in mammals. Representative compounds show significant improvement over imipenem.

35 The antibacterial properties of the compounds of the invention may also be demonstrated in vivo in conventional tests.

40 Carbapenem compounds have generally been found to be relatively non-toxic to warm-blooded animals, and this generalisation holds true for the compounds of the present invention. Compounds representative of the present invention were administered to marmosets at doses in excess of those required to afford protection against bacterial infections, and no overt toxic symptoms or side effects attributable to the administered compounds were noted.

45 The following results were obtained for representative compounds on a standard in vitro test system using Diagnostic Sensitivity Test. The antibacterial activity is described in terms of the minimum inhibitory concentration (MIC) determined by the agar-dilution technique with an inoculum size of 10<sup>4</sup> CFU/spot.

To a solution of 4-acetylthio-1-(4-nitrobenzyloxycarbonyl)-2-carboxypyrrolidine (1.85 g; 5mM) in dichloromethane (20 ml) was added oxalylchloride (0.53 ml; 6mM). A few drops of DMF were added to catalyse the reaction. The mixture was stirred for 1 hour. In the meantime, to a solution of 3-aminobenzoic acid (1.35 g, 10 mM) in dichloromethane (20 ml) was added diisopropylethylamine (5.2 ml, 30 mM). This solution was cooled to 0°C and stirred while the solution of the acid chloride (prepared above) was added from a syringe at such a rate as to keep the temperature below 10°C. When the addition was complete the mixture was stirred for a further 30 minutes without cooling and then evaporated to dryness. The residue was partitioned between ethyl acetate (200 ml) and hydrochloric acid (2M, 100 ml). The ethyl acetate layer was separated and washed successively with water (50 ml), saturated brine (50 ml) and then dried over magnesium sulphate and evaporated to give an oily solid (2.3 g). This was recrystallised from isopropanol (30 ml) to give the title compound as a white crystalline solid (1.6 g, m.p. 187-190°C).

After 1 hour a further amount of oxalyl chloride (0.20 ml, 1.1 mM) and DMF (2-3 drops) were added and the mixture stirred for a further hour. The solution was evaporated to leave a yellow gum. A solution of 4-nitrobenzyl (1R,5R,6S,8R)-6-(1-hydroxyethyl)-1-methyl-2-diphenylphosphoryloxycarbapenem-3-carboxylate (594 mg, 1 mmol) in DMF (5 ml) under argon was treated with (2S,4S)-1-(4-nitrobenzyloxycarbonyl)-2-(2-carboxymethylcarbamoyl-5-thienylcarbamoyl)pyrrolidine-4-ylthiol (from previous step), diisopropylethylamine (0.08 ml, 0.5 mmol), tributylphosphine (250  $\mu$ l, 1 mmol) and water (20  $\mu$ l, 1 mmol), for 12 hours at 4°C temperature. The mixture was then purified by subjecting to chromatography on a HP20SS column, eluting with a gradient of acetonitrile water to give title compound (175 mg, 21%).
